1 IS NOT A RECOGNIZED COMMAND

The previous command name entered was not recognized by the system. For a list of commands available to you in the current file, enter "HELP COMMANDS" at an arrow prompt (=>).

- => s 16 and ?aziri?
- LEFT TRUNCATION IGNORED FOR FILE 'REGISTRY'
- 39897 AZIRI?
- 4 L6 AND ?AZIRI?

Left truncation is not valid in the specified search field in the specified file. The term has been searched without left truncation. Examples: 'TERPEN?' would be searched as 'FLAVONOID' would be searched as 'FLAVONOID.'

If you are searching in a field that uses implied proximity, and you used a truncation symbol after a punctuation mark, the system may interpret the truncation symbol as being at the beginning of a term. Implied proximity is used in search fields indexed as single words, for example, the Basic Index.

AB The invention is a process for the preparation of crosslinked water-swellable polymer particles. First, an aqueous polymer solution containing a water-soluble

polymer having at least one functional group or charge, is combined with aqueous medium. The aqueous polymer solution is then mixed under moderate agitation

with an oil medium and an emulsifier to form an emulsion of droplets of the water-soluble polymer. A crosslinking agent capable of crosslinking the functional groups and/or charges in the water-soluble polymer is then added to the emulsion to form crosslinked water-swellable polymer particles. The invention also includes the particles formed by the process and aqueous dispersions containing the particles which are useful for administering to an

individual. The particles of the invention are useful for implantation, soft tissue augmentation, and scaffolding to promote cell growth. Microspheres were obtained from crosslinked droplets of Na alginate/Me cellulose by dispersing 50.0 g water containing 2.25 g Na alginate and 0.25 g Methocel K4H in 75.0 g isocotane containing 1.5 g Span 85; then 5.0 g water containing 1.0 g Tween 85 was added, and the dispersion was stirred. The droplets formed by the dispersion were crosslinked with an equivalent amount of the XAMA-7 crosslinked microspheres.

 ${\tt AB} \quad {\tt Crosslinked}$ water-soluble polymer particles are prepared by combining an aqueous

solution of a water-soluble polymer, particularly a polysaccharide, with an oil medium so as to form an emulsion of droplets of the water-soluble polymer, and adding to the emulsion a crosslinking agent so as to form crosslinked water-soluble polymer particles. Their use includes administration by injection to a patient in need of treatment an aqueous suspension of the water-soluble polymer particles. Thus, an aqueous solution of Na alginate containing

XAMA 7 as crosslinking agent at pH 11 was agitated with toluene in the presence of Span 60 to form a water-in-oil emulsion. When the desired droplet size distribution was obtained, the pH was adjusted to 7-8 with
